REASONS LEVITON IS A WORLD-CLASS MANUFACTURER OF MAKE-TO-ORDER COPPER NETWORK SYSTEMS

- 1.** Custom make-to-order (MTO) pre-terminated trunks streamline installation for large projects and create less jobsite waste. The factory-tested trunks include product labels with unique serial numbers, allowing for full traceability of description, date of manufacture, and all test results.
- 2.** Both cable and pre-terminated assemblies are made in the same UK Data Centre Factory, streamlining production and creating a smaller environmental footprint. And by ordering trunks from a fully integrated factory with inventory readily available, customers receive more responsive service and faster delivery times.
- 3.** High-performance Atlas-X1™ 6A system solutions support mission critical networks.
- 4.** Patented Retention Force Technology (RFT) in Atlas-X1 protects against tine damage from 4- or 6-pin plugs. Under PoE loads, RFT helps to prevent arcing damage in the contact region between the plug and jack, saving on costly repairs and increasing system longevity.
- 5.** Small diameter zone Cat 6A shielded cable allows for higher density and more efficient air flow, and increases installation efficiency.
- 6.** Expansive line of copper connectivity covers data centre to work station.
- 7.** Jacks, patch panels and pre-terminated trunks are engineered, manufactured and tested to rigorous standards in ISO 9001 and 14001 certified US and UK facilities.
- 8.** Copper systems are third-party verified to meet or exceed all current ISO and TIA category cabling and connectivity standards
- 9.** Online custom configurators make building the exact cable configurations easier than ever for rapid delivery to job sites.
- 10.** e2XHD high density snap-in cassette patching system is designed for fast single-click deployment and simple maintenance. It is the industry's only system that enables unshielded, shielded, and fibre in a single panel.
